Practical - IV

Roll No.: T003	Name: Pranay Bhadwalkar
Class: TYIT	Batch: B1
Date of Assignment: 24/07/2026	Date/Time of Submission: 24/07/2026

A MEDICAL TEST IS USED TO DETECT A PARTICULAR DISEASE.

The probability that a randomly selected person has the disease is **1%****.**

If a person has the disease, the test returns positive with probability **99%****.**

If a person does not have the disease, the test still returns positive with probability **5%**** (false positive rate).**

A person takes the test and receives a positive result.

Code:-

Probability of having disease

P_D = 0.01

Probability of positive test if disease exists

P_Pos_D = 0.99

Probability of positive test if disease does not exist

P_Pos_NotD = 0.05

Probability of not having disease

P_NotD = 1 - P_D

Bayes Rule

P_D_Pos = (P_Pos_D * P_D) / ((P_Pos_D * P_D) + (P_Pos_NotD * P_NotD))

print("Probability that person actually has disease:")

print(round(P_D_Pos * 100, 2), "%")

Output:

```
Probability that person actually has disease:
16.67 %
```
